

The LDE differential low pressure sensors are based on thermal flow measurement of gas through a micro-flow channel integrated within the sensor chip. The innovative LDE technology features superior sensitivity especially for ultra low pressures. The extremely low gas flow through the sensor ensures high immunity to dust contamination, humidity and long tubing compared to other flow-based pressure sensors.

Features

- Ultra-low pressure ranges from 25 to 500 Pa (0.1 to 2 inH₂O)
- Pressure sensor based on thermal microflow measurement
- High flow impedance
 - very low flow-through leakage
 - high immunity to dust and humidity
 - no loss in sensitivity using long tubing
- Calibrated and temperature compensated
- Unique offset autozeroing feature ensuring superb long-term stability
- Offset accuracy better than 0.2% FS
- Total accuracy better than 0.5% FS typical
- On-chip temperature sensor
- Analog output and digital SPI interface
- No position sensitivity

Certificates

- Quality Management System according to EN ISO 13485 and EN ISO 9001
- RoHS and REACH compliant

Media compatibility

Air and other non-corrosive gases

Applications

Medical

- Ventilators
- Spirometers
- CPAP
- Sleep diagnostic equipment
- Nebulizers
- Oxygen conservers/concentrators
- Insufflators/endoscopy

Industrial

- HVAC
 - VAV
 - Filter monitoring
 - Burner control
- Fuel cells
- Gas leak detection
- Gas metering
- Fume hood
- Instrumentation
- Security systems

Gas correction factors (4)

Gas type	Correction factor
Dry air	1.0
Oxygen (O ₂)	1.07
Nitrogen (N ₂)	0.97
Argon (Ar)	0.98
Carbon dioxide (CO ₂)	0.56

Specification notes

- (1) Sweep 20 to 2000 Hz, 8 min, 4 cycles per axis, MIL-STD-883, Method 2007.
- (2) 5 shocks, 3 axes, MIL-STD-883E, Method 2002.4.
- (3) The max. common mode pressure is $5\ \text{bar}$.

(4) For example with a LDES500... sensor measuring ${\rm CO_2}$ gas, at full-scale output the actual pressure will be:

 $\Delta P_{\rm eff}$ = $\Delta P_{\rm Sensor}$ x gas correction factor = 500 Pa x 0.56 = 280 Pa $\Delta P_{\rm eff}$ = True differential pressure

 ΔP_{Sensor} = Differential pressure as indicated by output signal

Offset long term stability

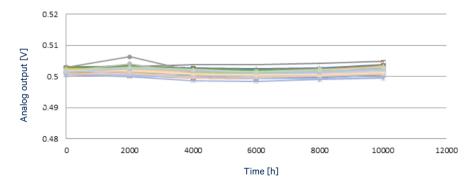

Fig. 2: Offset long term stability for LDE 250 Pa sensors after 10,000 hours @ 85°C powered, equivalent to over 43.5 years @ 25 °C (better than ±2 mV / ±0.125 Pa)

Specification notes (cont.)

(12) Total accuracy is the combined error from offset and span calibration, non-linearity, repeatability and pressure hysteresis

SPI - Serial Peripheral Interface

Note: it is important to adhere to the communication protocol in order to avoid damage to the sensor.

Introduction

The LDE serial interface is a high-speed synchronous data input and output communication port. The serial interface operates using a standard 4-wire SPI bus. The LDE device runs in SPI mode 0, which requires the clock line SCLK to idle low (CPOL = 0), and for data to be sampled on the leading clock edge (CPHA = 0). Figure 5 illustrates this mode of operation.

Care should be taken to ensure that the sensor is properly connected to the master microcontroller. Refer to the manufacturer's datasheet for more information regarding physical connections.

Application circuit

The use of pull-up resistors is generally unnecessary for SPI as most master devices are configured for push-pull mode. If pull-up resistors are required for use with 3 V LDE devices, howeer, they should be greater than 50 k Ω .

There are, however, some cases where it may be helpful to use 33Ω series resistors at both ends of the SPI lines, as shown in Figure 3.

Signal quality may be further improved by the addition of a buffer as shown in Figure 4. These cases include multiple slave devices on the same bus segment, using a master device with limited driving capability and long SPI bus lines.

If these series resistors are used, they must be physically placed as close as possible to the pins of the master and slave devices.

Signal control

The serial interface is enabled by asserting /CS low. The serial input clock, SCLK, is gated internally to begin accepting the input data at MOSI, or sending the output data on MISO. When /CS rises, the data clocked into MOSI is loaded into an internal register.

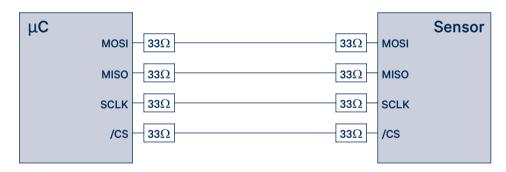

Fig. 3: Application circuit with resistors at both ends of the SPI lines

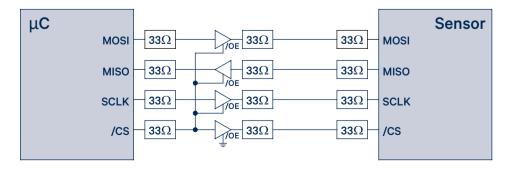

Fig. 4: Application circuit with additional buffer

SPI - Serial Peripheral Interface (cont.)

Note: it is important to adhere to the communication protocol in order to avoid damage to the sensor.

Data read – pressure

When powered on, the sensor begins to continuously measure pressure. calculated as follows: To initiate data transfer from the sensor, the following three unique bytes must be written sequentially, MSB first, to the MOSI pin (see Figure 5):

Pressure [Pa]

Step	Hexadecimal	Binary	Description
1	0x2D	B00101101	Poll current pressure measurement
2	0x14	B00010100	Send result to data register
3	0x98	B10011000	Read data register

The entire 16 bit content of the LDE register is then read out on the MISO pin, MSB first, by applying 16 successive clock pulses to SCLK with /CS asserted low. Note that the value of the LSB is held at zero for internal signal processing purposes. This is below the noise threshold of the sensor and thus its fixed value does not affect sensor performance and accuracy.

From the digital sensor output the actual pressure value can be calculated as follows:

For example, for a ±250 Pa sensor (LDES250B...) with a scale factor of 120 a digital output of 30 000 counts (7530'h) calculates to a positive pressure of 250 Pa. Similarly, a digital output of -30 000 counts (8AD0'h) calculates to a negative pressure of -250 Pa.

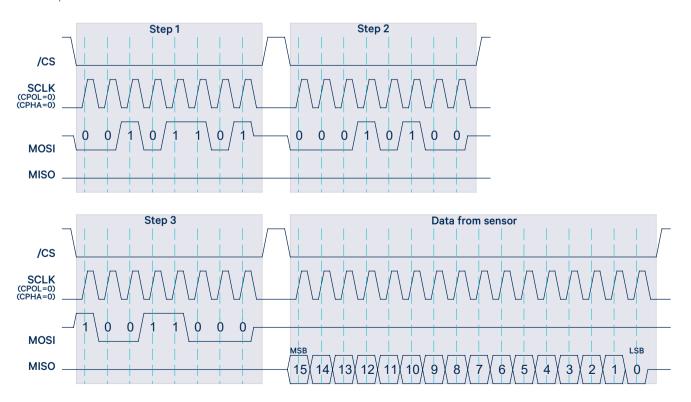

Fig. 5: SPI data transfer

SPI - Serial Peripheral Interface (cont.)

Data read – temperature

The on-chip temperature sensor changes 95 counts/°C over the operating range. The temperature data format is 15-bit plus sign in two's complement format. To read temperature, use the following sequence:

Step	Hexadecimal	Binary	Description
1	0x2A	B00101010	Poll current temperature measurement
2	0x14	B00010100	Send result to data register
3	0x98	B10011000	Read data register

From the digital sensor output, the actual temperature can be calculated as follows:

Temperature [°C] =
$$\frac{\text{TS - TS}_0 \text{ [counts]}}{\text{Scale factor}_{\text{TS}} \left[\frac{\text{counts}}{\text{°C}} \right]} + \text{T}_0 \left[\text{°C} \right]$$

where

TS is the actual sensor readout;

 TS_0 is the sensor readout at known temperature $T_0^{(13)}$;

Scale factor_{TS} = 95 counts/°C

Specification notes (cont.)

(13) To be defined by user. The results show deviation (in $^{\circ}$ C) from the offset calibrated temperature.

Specification notes (cont.)

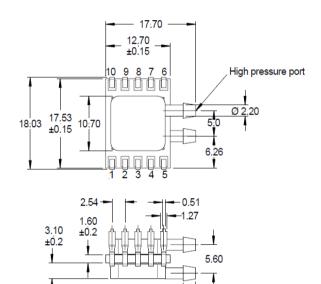

(14) For correct operation of LDE...3... devices, the device driving the SPI bus must have a minimum drive capability of ±2 mA.

Dimensional drawing

- LDE...E... (SMD, 2 ports same side)

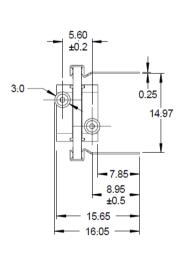

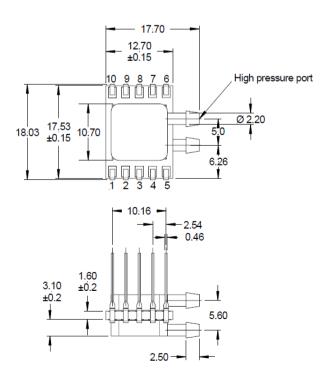

2.50

dimensions in mm, all tolerances ±0.1 mm unless otherwise noted

- LDE...F... (DIP, 2 ports same side)

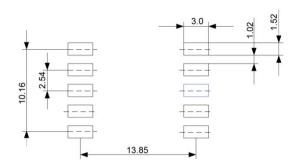

dimensions in mm, all tolerances ±0.1 mm unless otherwise noted

Sensor PCB footprint

dimensions in mm, all tolerances ±0.1 mm unless otherwise noted

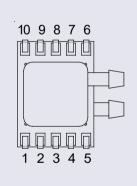

Electrical connection(15)

There are three use cases that will change the manner in which the LDE series device is connected in-circuit:

Case 1: Reading of pressure measurement as a digital (SPI) signal;

Case 2: Reading of pressure measurement as an analog (voltage) signal;

Case 3: Pin-to-pin compatible drop-in replacement for LBA series devices (5 V LDE devices only).

Pin	Function	Digital signal output	Case 2: Analog signal output	LBA drop-in replacement (5 V only)
1	Reserved	NC	NC	GND
2	V _s	+5V/+3V	+5V/+3V	+5V
3	GND	GND	GND	GND
4	Vout	NC	High impedance analog input	High impedance analog input
5	Vout	NC	(e.g. op-amp, ADC)	(e.g. op-amp, ADC)
6	SCLK	Master device SCLK	GND	GND
7	MOSI	Master device MOSI	GND	GND
8	MISO	Master device MISO	GND	GND
9	/CS	Master device (/CS)	V_s	GND
10	Reserved	NC	NC	GND

Ordering information

Series	Pressure range		Calibration		Housing	Output	Grade
LDE	S025	25 Pa (0.1 inH ₂ O)	В	Bidirectional	E [SMD, 2 ports, same side]	3 [Non-ratiometric, 3 V supply]	S [High]
	S050	50 Pa (0.2 inH ₂ O)	U	Unidirectional	F [DIP, 2 ports, same side]	6 [Non-ratiometric, 5 V supply]	
	S100	100 Pa (0.4 inH ₂ O)					-
	S250	250 Pa (1 inH ₂ O)	_				
	S500	500 Pa (2 inH ₂ O)	_				

Order code example: LDES250BF6S

Specification notes (cont.)

(15) The maximum voltage applied to pin 1 and pins 6 through 10 should not exceed $V_{\rm S}$ +0.3 V.
