

MS4525DO

SPECIFICATIONS

- ◆ PCB Mounted Digital Output Transducer
- ◆ Combination Temperature and Pressure
- ◆ I²C or SPI Protocol
- ◆ Differential, Gage, Absolute, Compound, & Vacuum
- ◆ Temperature Compensated
- ◆ 3.3 or 5.0 V_{DC} Supply Voltage
- ◆ Low Power Option Available (standby < 1μA)

FEATURES

- ◆ PSI Pressure Ranges
- ◆ PCB Mountable
- ◆ Digital Output
- ◆ Barbed Pressure Ports

APPLICATIONS

- ◆ Blocked Filter Detection
- ◆ Altitude and Airspeed Measurements
- ◆ Medical Instruments
- ◆ Fire Suppression System
- ◆ Panel Meter
- ◆ Air Movement/Environmental Controls
- ◆ Pneumatic Controls

The MS4525DO is a small, ceramic based, PCB mounted pressure transducer from Measurement Specialties. The transducer is built using Measurement Specialties' proprietary UltraStable™ process and the latest CMOS sensor conditioning circuitry to create a low cost, high performance digital output pressure (14bit) and temperature (11bit) transducer designed to meet the strictest requirements from OEM customers.

The MS4525DO is fully calibrated and temperature compensated with a total error band (TEB) of less than 1.0% over the compensated pressure range. The sensor operates from single supply of either 3.3 or 5.0V_{DC} and requires a single external component for proper operation

The rugged ceramic transducer is available in side port, top port, and manifold mount and can measure absolute, gauge, differential, vacuum or compound pressure from 1 to 150psi. The 1/8" barbed pressure ports mate securely with 3/32" ID tubing.

Notes

1. Proper operation requires an external capacitor placed as shown in Connection Diagram. Output is not ratiometric to supply voltage.
2. The maximum deviation from a best fit straight line (BFSL) fitted to the output measured over the pressure range at 25C. Includes all errors due to pressure non linearity, hysteresis, and non repeatability.
3. Total pressure error band includes all accuracy errors, thermal errors over the compensated temperature range and span and offset calibration tolerances. For ideal sensor output with respect to input pressure and temperature, reference Transfer Function charts below. TEB values are valid only at the calibrated supply voltage.
4. The deviation from a best fit straight line (BFSL) fitted to the output measured over the compensated temperature range.
5. For errors beyond the compensated temperature range, see Extended Temperature Multiplier chart below.
6. Start time to data ready is the time to get valid data after POR (power on reset). The time to get subsequent valid data is then specified by the update time specification.
7. This product can be configured for custom OEM requirements, contact factory for lower power consumption or higher accuracy.

AVAILABLE OPTIONS

Gel Coat (-F Option)

The MS4525DO is designed for non-ionic and clean dry air applications. Select this option for added protection in high humidity or slightly corrosive environments with the application of a silicone gel elastomer to sensor and ASIC. For questions concerning media compatibility, contact the factory.

Low Power (-L Option)

Select this option for battery powered or handheld device applications. In this configuration, the sensor and calibration microcontroller are powered down, drawing a current of $\sim 0.6\mu\text{A}$ ($V_s=5.0\text{ V}_{\text{DC}}$). When the master sends a **Read MR** (measurement request) command (I²C or SPI); the sensor is “awaken” and begins the measurement cycle; data is then placed onto the output registers. The sensor and calibration microcontroller are powered down again, awaiting the **Read DF** (data fetch) command from the master.
